                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        unknown function. The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coll. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 6; Page 597-598; 989pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klabsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets of antibiotic development. The antisense nucleic acids can also be used CC to identify proteins used in proliferation, to express these proteins. CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen CC programmes. The antisense nucleic acid sequence is also useful to screen CC essential prokaryotic cellular proliferation protein.

CC wide variety of organisms. The present sequence represents an CC essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wipo at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          An artificial polynucleotide, encoding an HN and/or F polypeptide of Newcastle Disease Virus (NDV) DNA, a bioprecursor of the polypeptide, or an epitopic portion of the polypeptide or an artificial nucleotide complementary to the polynucleotide are claimed. The polynucleotides are useful for preparing a probe for extracting similar genes from a gene library or for identifying the prescence of NDV virons in a sample obtd. from poultry.
                                      Newcastle Disease Virus (NDV) HN and F genes were inserted as a Sfil fragment into the homology vector 443-88.8 at the unique sfil site. The NDV HN and F genes were inserted in the same transcriptional orientation as the ORF in the parental homology vector. The sequence of Sfil fragment is in AAQ68943/R58858/AAR58859. The inserted Sfil fragment has the following structure: Junction A - Fragment 1 (HN, AAs 2-577) - Junction B - Fragment 2 (F, AAs 1-553) - Junction C - Fragment 3 (BRS32) - Junction D. Fragment 1 is approx. 1811 bp AvaII to Nael fragment of the NDV HN CDNA clone (Bl strain). Fragment 2 is an approx 1812 bp BamHI to PstI fragment of the full length NDV F CDNA (Bl Strain). Fragment 3 is an approx 235 bp PstI and Scal fragment of the plasmid pBR322.
                                                                                                                                                                                                                                                          Disclosure; Page 70-72; 85pp; English.

Newcastle disease virus (NDV) HN and F genes. The Structure of the fragment is: 5'- Junction A - Fragment 1 (NDV HN AAS 2-57) - Junction B - Fragment 2 (NDV F AAS 1-553) - Junction C - Fragment 3 (pBR322) - Junction D - 3'. Fragment 1 is Avail to Nael fragment of the full length NDV HN CDNA clone (Bl strain). Fragment 2 is BamHI to PstI fragment of the full length NDV F cDNA (Bl strain). Fragment 3 is a PstI and Scal fragment of pBR322. The structures of the Junctions A, B, C and D are given in AAQ70552, AAQ70553, AAQ70554 and AAQ70555 respectively.
AAW06828 standard; Protein; 553 AA
                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant fowl pox viruses – useful as vaccines against fowl pox virus, Newcastle Disease Virus and infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cochran

The genes (see also AA748510) for HN and F be inserted into homology vector 443-88.8 (see also AA748511) at unique Sfil site, yielding homology vector 507-26.22 (see also AA748502-05), which can be used to insert the NDV HN and F genes into fowlpox virus. The recombinant virus is used to deliver the vaccine antigens to poultry.

The virus is used as a vaccine for immunising chickens against
                          The present sequence is provided in a specification relating to a recombinant fowlpox virus (FPV) that comprises a foreign DNA inserted within a 3.5 kb EcoRI fragment of the FPV genomic DNA. The foreign DNZ can be expressed in host cells infected with FPV. The recombinant FPV may be used in vaccines to protect animals (especially chickens) again fowlpox and, depending on the source of the foreign DNA, other disease

                            without the addition of exogenous proteolytic activity. Also it is possible to generate a stable transfected cell line that expresses the wild-type F protein in the virus envelope therefore providing infectious particles, useful in the form of a vaccine, especially against respiratory and/or gastrointestinal diseases. NDV can be easily cultured to very high titers in embryonated eggs. Mass culture of embryonated eggs is relatively cheap. NDV vaccines are relatively stable and can be simply administered by mass application methods e.g. drinking water or by spraying or by aerosol formation. The natural route of infection is by the respiratory and/or gastrointestinal tract which are also the major routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circulating maternal antibody. This sequence represents a protein encoded by the NDV strain LaSota genome which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                    This invention describes a novel avian paramyxovirus cDNA (I) which comprises a nucleic acid sequence corresponding to the 5' terminal end of the genome of avian paramyxovirus allowing the generation of end infectious copy of avian paramyxovirus. The cell line is useful for an infectious copy of avian paramyxovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   23-DEC-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Avian-paramyxovirus;

The invention relates to a recombinant fowlpox virus (FFV)

CC comprising a foreign DNA inserted into a 4.2 kb EcoRI fragment

CC comprising a foreign DNA inserted into a 4.2 kb EcoRI fragment

CC comprising a foreign DNA inserted into a 4.2 kb EcoRI fragment

CC comprised in a host cell into which the fowlpox virus has been

CC introduced and encodes an antigenic protein. The antigenic protein

CC which may be expressed includes infectious laryngotracheits virus

CC (IITV) 91ycoprotein B (9B) or 91ycoprotein D(9D, ANY58184), Newcastle

CC disease virus (NDV) haemagglutinin (HN, ANY58182) or fusion (F) protein

CC disease virus (NDV) haemagglutinin (HN, ANY58182) or fusion (F) protein

CC disease virus on the same virus B or gD. The foreign DNA may

CC alternatively encode a cytokine such as chicken myelomonocytic growth

CC recombinant FPV is under the control of one or more synthetic pox

CC gene expression. The synthetic pox virus promoters that may be used are

CC gene expression. The synthetic pox virus promoters that may be used are

CC based on promoters of the vaccinia virus and include early promoter 1

CC (EPI), late promoter 1 (LPI), EP2 and LP2 (AAX9291-Z49294,

CC recombination between FPV DNA and a homology vector containing the

CC recombination are used as multivalent live vaccines for immunising fowl

CC against Marek's disease virus, NDV, LITVY and/or fowlpox virus. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAG82132
                                   C(II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. C(II), and (II) can have antibacterial activity and therefore can be used cin vaccination. The nucleic acids (I) may be used to produce the CC s. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the CC containing them which are used to produce hosts cells which express the CC containing them which are used to produce hosts cells which express the CC containing them which are used to produce hosts cells which express the CC containing them which are used to assay for other inhibitors of their cativity and therefore identify compounds that may be used for the CC containing the containin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

Sequence 6, Application US/09242690A

Patent No. 6284534

GENERAL INFORMATION:

APPLICANT: WAINEA, YUTAKA

TITLE OF INFUNION: YEAST VECTOR AND METHOD OF PRODUCING PROTEINS USING THE

TITLE OF INFUNION: YEAST

FILLS REFERENCE: 049441/0118

CURRENT APPLICATION NUMBER: US/09/242,690A

CURRENT APPLICATION NUMBER: US/09/242,690A

CURRENT PILLNG DATE: 1999-02-23

PRIOR APPLICATION NUMBER: POT/JP97/02924

PRIOR FILING DATE: 1997-08-23

INUMBER OF SEQ ID NOS: 66

SEQ ID NOS: 6

CURRENT: PATENTIN Ver. 2.1

SEQ ID NOS: 6

Nature 403, 665-68, 2000
A; Title: The genome sequence of the food-bor
A; Reference number: AB1250; MUID:20150912
A; Accession: EB1339
A; Status: preliminary
A; Molecule type: DNA
A; Residues: 1-1250 <PAR>
A; Cross-references: GB:AL139076; GB:AL111166
A; Experimental source: serotype 02, strain N
C; Genetics:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       probable NAD(P)-dependent oxidoreductase homolog lmo0546 [imported] - Listeria

CATALYTIC ACTIVITY: L-glutamate 5-semialdehyde + phosphate

NADP(+) = L-gamma-glutamyl 5-phosphate + NADPH.

ENZYME REGULATION: FEEDBACK REGULATED BY PROLINE.
